

InventiX: after changing network

Hotspot, campus WiFi, home WiFi — your laptop gets a new address each time. Do these 4 steps.

1. Find your new address

1. Open Command Prompt and run:

```
ipconfig
```

2. Under **Wi-Fi**, copy the **IPv4 Address** (for example `192.168.8.177`).

Below, `NEW-IP` means that address.

2. Update the app's .env

Open `frontend/.env` and change this line:

```
EXPO_PUBLIC_API_URL=http://NEW-IP:8000
```

3. Update Supabase (only needed for Google sign-in)

1. Supabase dashboard → **Authentication** → **URL Configuration**.
2. **Site URL** → set to:

```
exp://NEW-IP:8081/--/
```

then click **Save changes**.

4. Restart backend and Expo

Terminal 1 — in `backend`, with the venv active:

```
uvicorn app.main:app --host 0.0.0.0 --port 8000
```

Terminal 2 — in `frontend`:

```
npx expo start --clear
```

Scan the new QR code on the phone.

Still not working? Open `http://NEW-IP:8000/docs` in the phone's browser.

If it does not load, that network blocks phone-to-laptop traffic (common on campus WiFi). Use your hotspot instead.

When building the real app: set the Supabase Site URL to `inventix://`.
